

Buildings and Infrastructure

As part of the capital budget process, each agency must submit a list of all buildings and infrastructure. This inventory list is then applied to industry formulas that calculate how much should be spent to maintain the state's building and infrastructure assets. The remainder of this section provides information on the building repair formula and the infrastructure repair formula.

These formulas should be used as a guide by state agencies in their budget requests and will be used by the Office of Management and Budget as it formulates the executive recommendation.

In January, the current inventory of buildings and infrastructure is sent to each agency along with instructions on updating the inventory lists.

Note: The formulas outlined below are based on annual needs and must be doubled to meet North Dakota's biennial budget period.

Extraordinary Repairs - Buildings

Formulas are generally used to calculate the cost of adequately maintaining buildings. The formula selected for use in North Dakota is generally applicable, simple to apply, easy to understand, self-adjusting, and reliable.

The formula is based on the following premises:

1. The formula reflects current building valuation.
2. The formula recognizes that as a general policy, fewer resources should be directed to building renewal than the cost of building replacement.
3. The formula recognizes that older buildings require proportionally more repair funds than do newer buildings.
4. The formula is applied to an entire facility system in an actuarial manner, generating a pool of funds to be used on extraordinary repairs.

Building Formula

The annual extraordinary repairs formula for buildings is as follows (Building Replacement Value = BRV):

Buildings 5 years old or older at mid-year of biennium
(BRV) x 2% = Formula Amount

Buildings less than 5 years old = 0

Building Replacement Value

The North Dakota Century Code requires that state buildings built after 1939 are insured at replacement value. Agencies should utilize the building's insured value as the building value factor (BRV). All state-owned buildings are insured through the Fire and Tornado Fund.

Any difference between the insured value and the building value used in the formula must be documented by the agency and approved in writing by the Office of Management and Budget prior to final submission of the capital budget inventory.

Building Age Factor

The building age is determined by subtracting the year a building was built or extensively renovated from 2020, the mid-year in the 2019-21 biennium. If a building was built or renovated in 1986, the building age factor is 34 (2020 minus 1986).

Extraordinary Repairs - Infrastructure

Infrastructure is defined as a structure outside of and apart from a building, but necessary to the functioning of the building. Examples of infrastructure include water and sewer lines, electrical lines, parking lots, sidewalks and roads.

Recognizing that formulas based on building value would not provide adequate funding for infrastructure needs, the following formula is used in calculating costs of extraordinary repairs to infrastructure.

Infrastructure Formula

The annual extraordinary repairs formula for infrastructure is as follows:

$$P \times R = \text{Formula Amount.}$$

P = Infrastructure renewal percentage.

R = Infrastructure replacement value (per unit value times the number of units).

Infrastructure Renewal Percentage

The infrastructure renewal percentage is the straight-line depreciation over the normal life of the item. For example, the infrastructure renewal percentage for an item with a 20-year normal life is five percent.

Infrastructure Replacement Value

Infrastructure will be valued at replacement cost. Expertise from the Facility Management Division of OMB was used to determine unit replacement costs and parameters applicable to the valuation of the following types of infrastructure:

7050	Emergency Generator 1400-1500KW	650,000.00	ea	30

The infrastructure cost list represents an effort to accurately assign replacement costs to infrastructure items throughout the state. These costs were arrived at using recent bid tabulations, information from several city engineers, estimates from consulting engineers, and costs from various state agencies. This list is not all-inclusive, but includes the majority of items that will be found on state properties.

The cost list is meant to assign a replacement value to infrastructure, and will be used for formula budgeting purposes. Actual costs of a replacement project will differ for each case; these numbers are for formula budgeting purposes only. The costs do not take into account variations in building code requirements. The following paragraphs describe each category, and provide information on how the numbers should be applied.

Parking Lots: Parking lot value is calculated on a per square foot basis, applying the appropriate unit cost for the material used. Catch basins and curb and gutter are separated out, since many lots have islands or other structures that need to be accounted for. The unit costs include site preparation on virgin soil, and do not take into account the removal or relocation of utilities, lights, or existing concrete and asphalt.

Storm Sewer: Storm sewer is calculated by the lineal foot. Catch basins and access holes are included in the per foot cost. Standard sizes are used on this list, as opposed to listing every possible size. For replacement cost purposes, if the size currently used doesn't appear on the list,

use the next larger standard size. This was done to keep the list short, and assumes that a replacement would also increase capacity. Excavation is based on virgin soil, and does not include repairs to streets or relocating utilities.

Water Main and Feed Lines: Water lines are calculated on a per lineal foot basis, from the building foundation to the city connection. If the city owns the line from the main to the curb stop/shut-off, it should not be counted. Again, standard sizes were used; use the next larger size if currently used lines fall between the standard sizes. It is assumed that most replacement would be done with PVC piping. Excavation is based on virgin soil.

Sanitary Sewer: Sanitary sewers are calculated on a per lineal foot basis, with the access holes being included in the cost. Standard sizes were again used, with the assumption being made that replacement would be done with PVC. Excavation is based on virgin soil. Major structures such as lift stations and lagoon pump houses should be considered as buildings, with the pumps and controls being fixed equipment. Septic systems are considered to be building plumbing.

Electrical: This category deals with high voltage transmission lines, transformers and high voltage switch gear considered fixed equipment. Lines are calculated on a per lineal foot basis. Typical conduit installation consists of three 4" PVC conduits containing conductors, with the conduits being encased in concrete underground. Direct buried lines are simply trenched-in conductors. Excavation is based on virgin soil. Overhead lines should be considered at the conduit price, as the price is nearly the same, and most overhead replacements are going underground.

Steam Line, Direct Buried: Direct buried lines are encased in a conduit and are calculated on a per lineal foot basis. The cost is based on virgin soil and does not take into account the removal of the existing line. Standard sizes were used as before, and the cost of access structures is included.

Condensate, Direct Buried: Same considerations as steam line.

Utility Tunnels: Tunnels are calculated on a per lineal foot basis, applying the unit cost for the appropriate size of tunnel. Tunnels may or may not contain steam and condensate lines, or other utilities. For steam tunnels, a standard 6" size was used for both lines, with uni-strut pipe support structure being used. The 6" pipe size represents an average, since there are combinations of sizes too numerous to list for this purpose. The access holes, expansion joints, and coffin boxes are included in the per foot cost.

Gas Mains: Gas mains are calculated on a per lineal foot basis, with unit costs for 2" and 3" high-pressure PVC, and 4" steel as the standard sizes. Excavation is based on virgin soil, and meters are not included in the cost.

Telecom: This category covers the lines outside of buildings, up to the building entrance terminal. The lines are categorized by function, with the first category being the backbone. The trunk lines are broken down based on whether they serve academic or housing buildings. Aerial cable and broadband coax are also separated. Any components inside of the buildings are not counted as infrastructure, and should be included in the building valuation. All costs are calculated on a per lineal foot basis, with access structures included in the cost.

Sidewalk: Sidewalks are calculated on a per square foot basis, depending on the concrete thickness. Patio block is categorized separately. Curb cuts for handicapped access are not included in the costs.

Lighting: This section deals with exterior site lighting, which is on a replacement basis to include the light fixtures. The 30' and 75' poles are standard, street or parking lot lighting. "On Building" refers to light fixtures on building exterior walls or roofs that are used for site or security lighting. Walkway lights are typically 10'-15' tall, and are installed along sidewalks. The Hi-Mast is an omni-directional light pole used to illuminate parking lots or other large areas. All costs are per pole or fixture.

Razor Wire: Standard concertina type security wire, calculated on a per foot basis.

Streets and Roads: Streets and roads are calculated on a per lineal foot basis, using the factor for the appropriate type of road. Standard types were used; use the type that would be used in replacing existing roadways. Costs include removal of old street, but do not include catch basins or access holes. Curb and gutter are also included, as is the re-connection with existing sidewalks (ramped).

Fencing: Calculate by the lineal foot for each type. Includes the fencing and the posts.

Miscellaneous Items:

Tennis courts: calculate by square footage.

Running tracks: calculate by square footage, includes track markings.

Retaining walls: calculate by the lineal foot.

Bleachers, per 100-person section: for fixed athletic seating outdoor,

Communication Tower: calculate per tower.

Walk tunnels, Johnston Skywalk, and CAS Skywalk: calculate by the foot.

Flag Poles, Water Wells, Septic Systems, Lagoons, Hydrants, Basketball/Softball items, Shelters, Tanks, Boating, Radar items, Bridges, and Manholes: Calculate by each.

Irrigation:

Irrigation wells: calculate by each.

Underground sprinklers: calculate by square yardage of grounds served by the system.

Irrigation lines: calculate by lineal foot.
